

Raspberry Pi Single-Board Computers for Testing: How Berry Traces have Changed our Lives

Dirk Lüdtkke, Andreas Lauterbach,
Fabian Staudinger

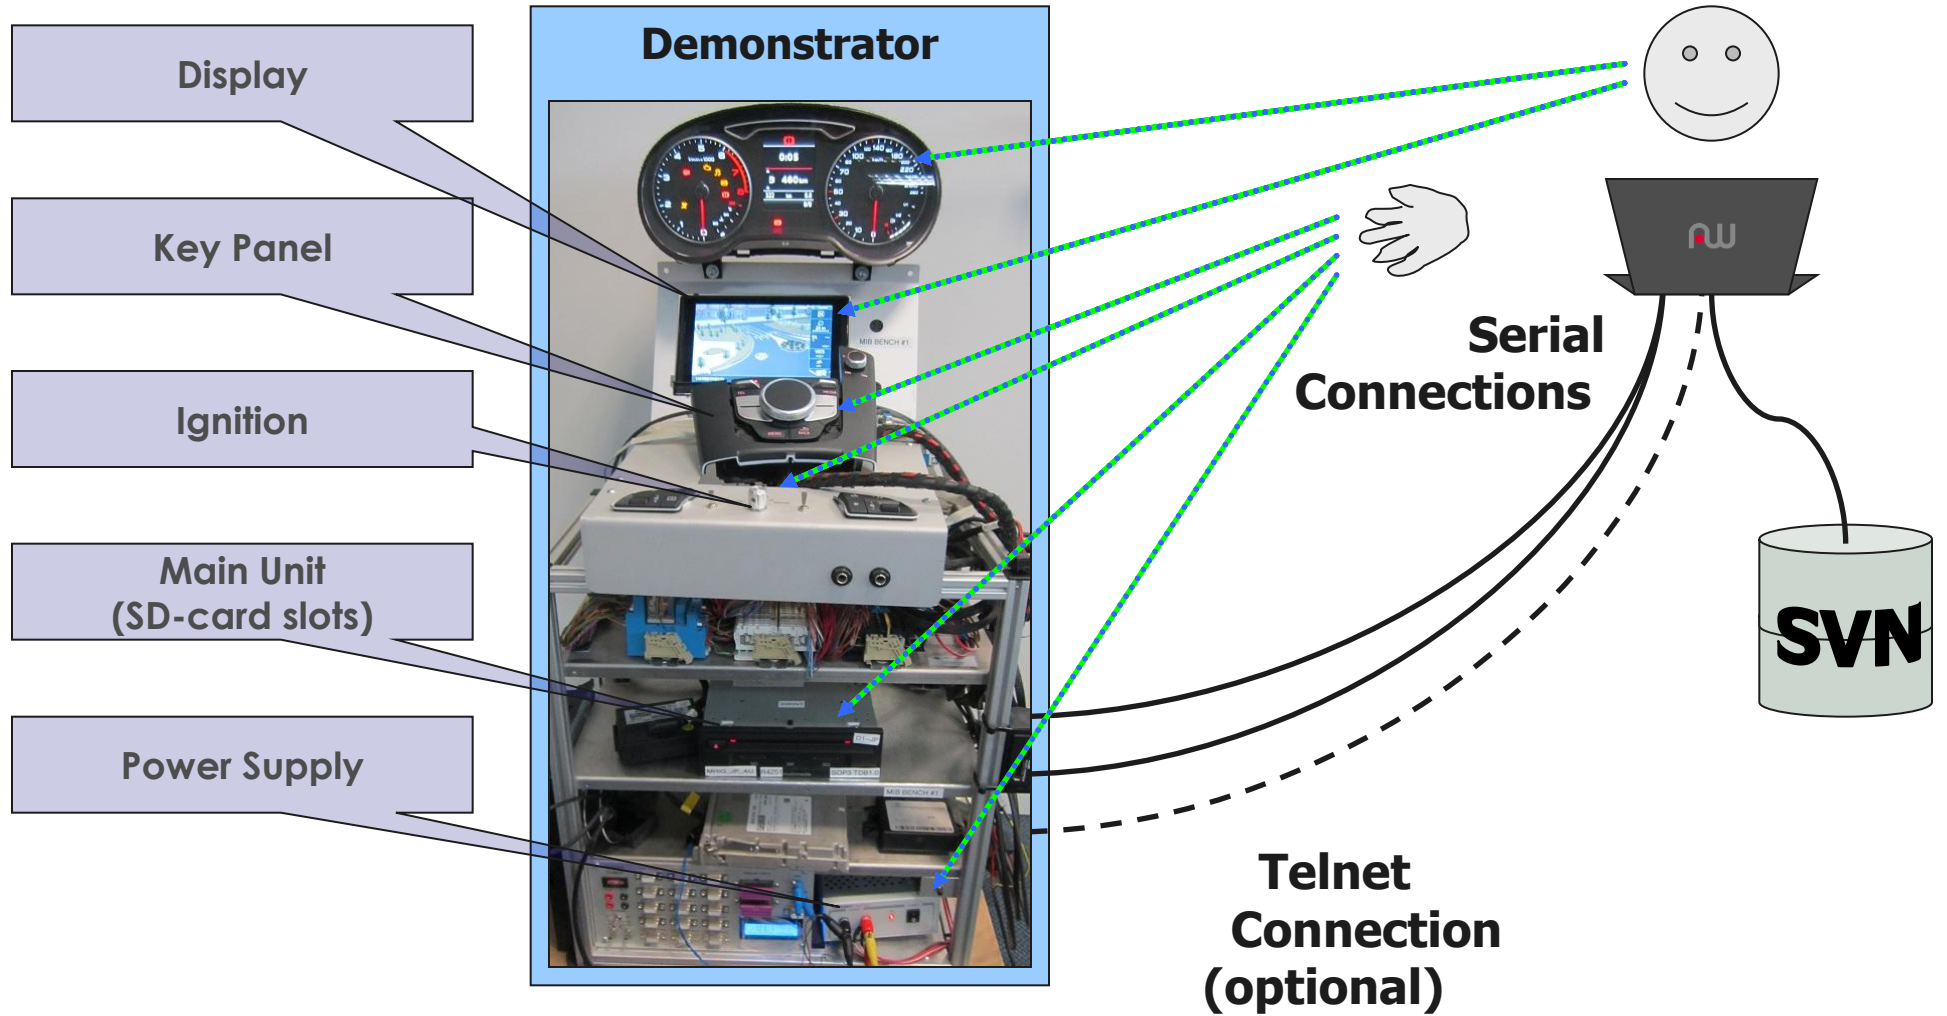

Background

- ▶ Product
 - ▶ Software for in-vehicle Infotainment Systems
 - ▶ navigation, audio, video, online services, speech dialog system
 - ▶ Premium systems (asia market)
- ▶ Tasks
 - ▶ Software integration and smoke testing
 - ▶ Recording of traces (baseline for later analysis)
- ▶ Sponsor
 - ▶ AW Technical Center Europe (Munich)
 - ▶ Subsidiary of Aisin AW (Japanese automotive supplier)

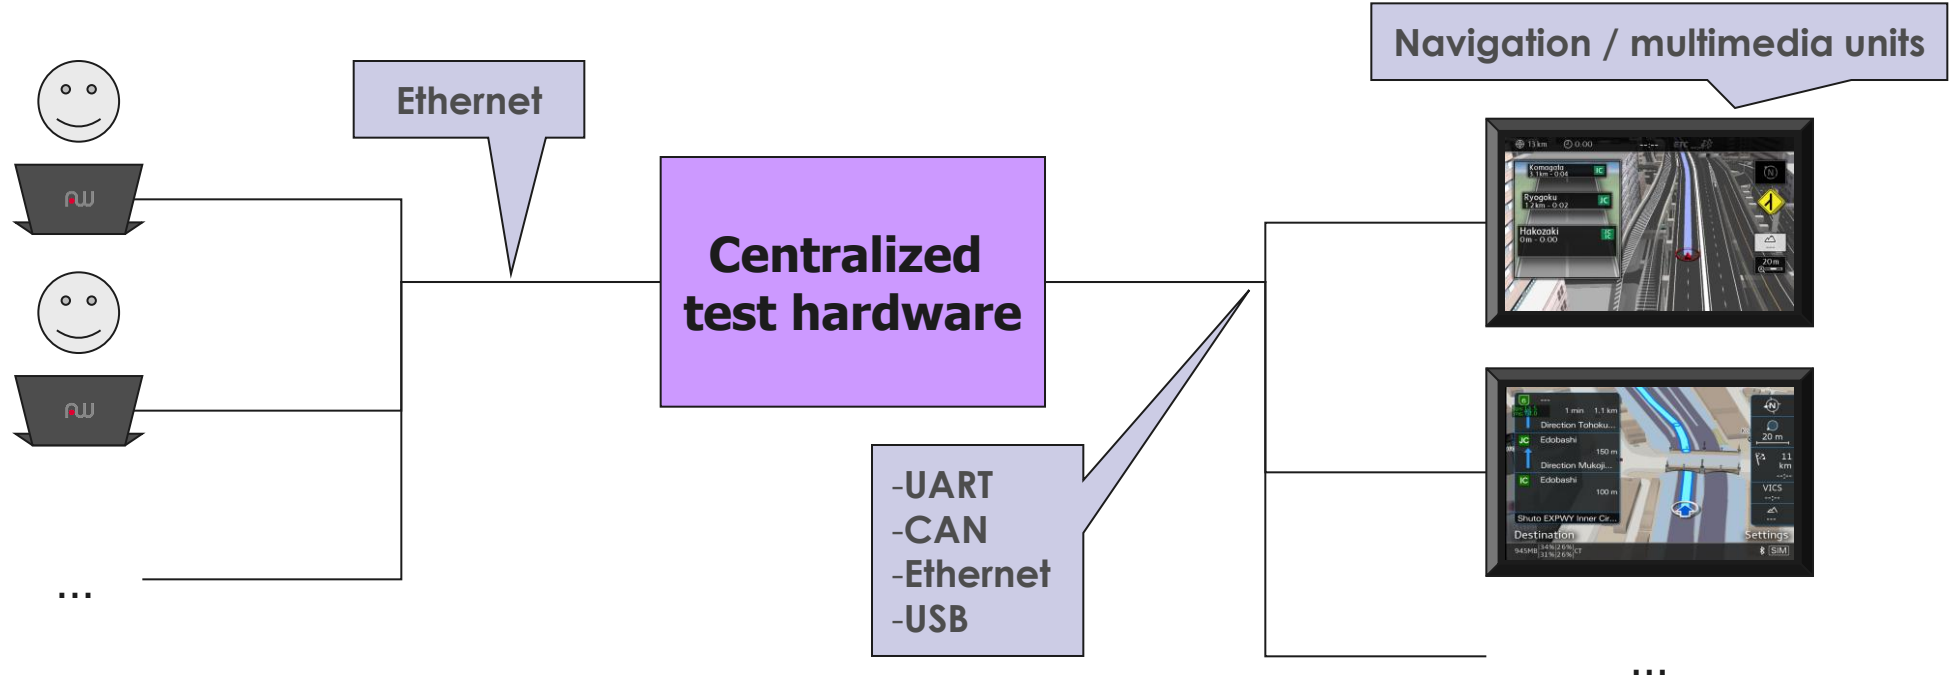

Introduction

- ▶ Quantity of releases
 - ▶ 4 regions, 5 car manufacturers, different models, overlapping SOPs
 - ▶ up to 45 Software releases per week
- ▶ Automation of software build and assembly
 - ▶ manual integration 8 hours -> 2 hours (human effort)
 - ▶ difficult to reduce further
- ▶ Automation of testing
 - ▶ manual testing takes about 1 hour
 - ▶ can be reduced by factor 4
 - ▶ functionality can be extended (more traces, more self tests)

Manual testing

Approach A

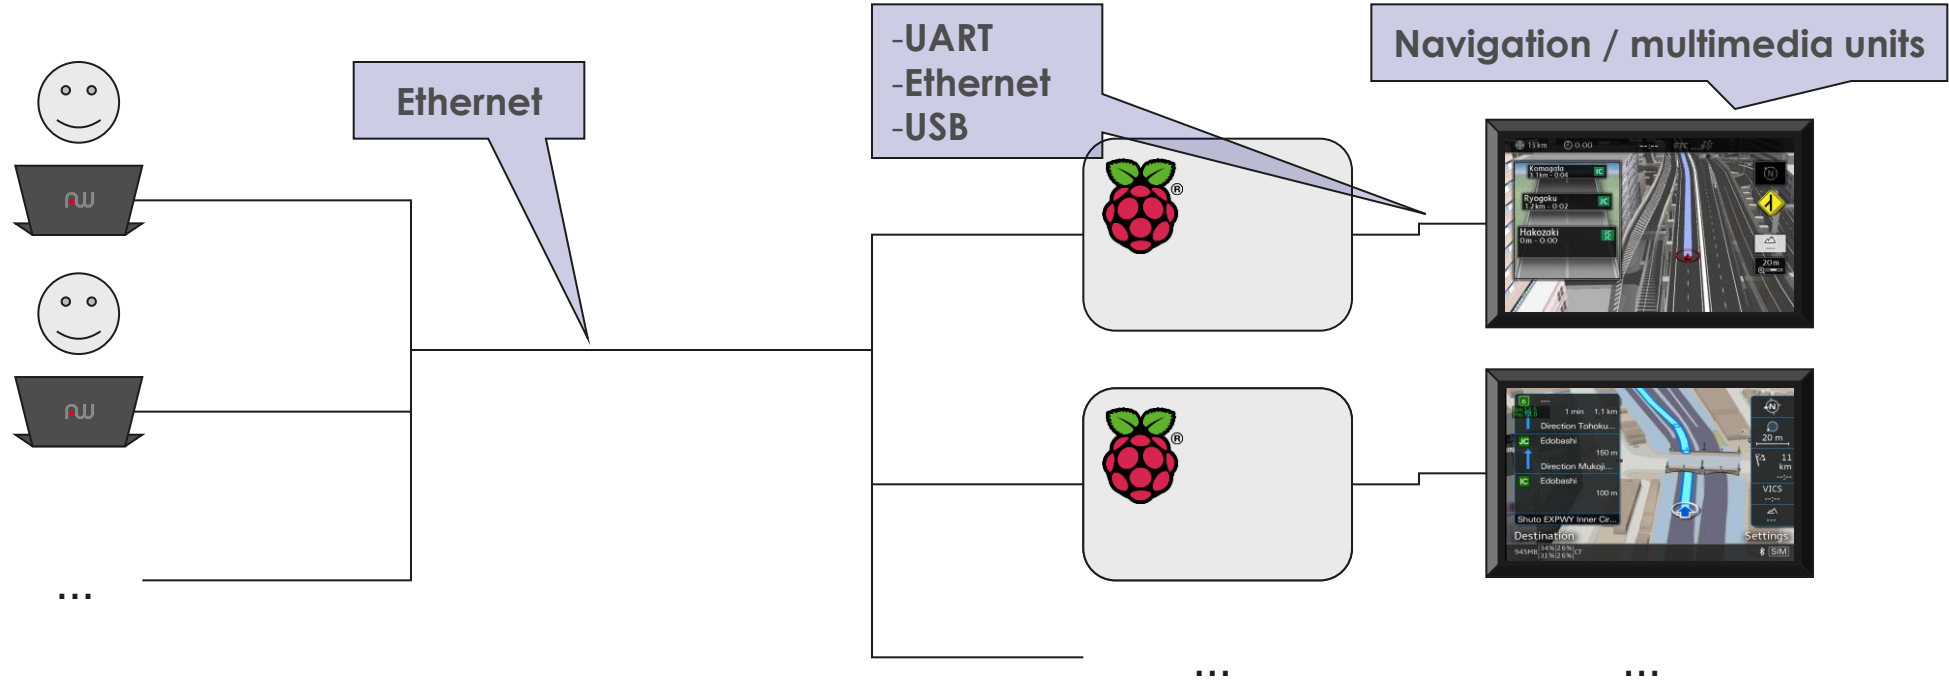

▶ Advantages

- ▶ Already in use
- ▶ Full range of features (frame-grabbing, key-panel-simulation)

▶ Disadvantages

- ▶ PXI-Hardware: > 20,000 EUR
- ▶ Still requires adaptation effort
- ▶ Outage risk

Approach B

▶ Advantages

- ▶ Hardware: ~ 350 EUR per demonstrator
- ▶ Distributed system
- ▶ Scalability

▶ Disadvantages

- ▶ Development: ~ 5,000 EUR
- ▶ Limited features

Implementation 1

- ▶ Python
 - ▶ pyserial
 - ▶ pysvn
 - ▶ blends into existing system (mostly in Python)
 - ▶ in-house logging modules
 - ▶ in-house SVN modules

- ▶ Configuration
 - ▶ Stores settings for various demonstrators
 - ▶ Serial-USB adapters
 - ▶ Preferences of the developers
 - ▶ SVN structure

Implementation 2

- ▶ Classes for logical/physical structures
 - ▶ Ignition
 - ▶ Power Supply
 - ▶ Main Unit
 - ▶ SVN
- ▶ Main test sequence
 - ▶ Connection tests
 - ▶ On/Off cycle (Main Unit)
 - ▶ Traces / several logs / SVN / ...
- ▶ Multithreaded tracing and logging

```
pi@traceberry2 ~/work/traceberry/v00.51 $ python3 Traceberry.py -t
+-----+
+-----+ TRACEBERRY +-----+
+-----+ small but mighty +-----+
+-----+

Trace of MMX and RCC will be logged.

Use AMI to download debug-info automatically? [yn]: y
The debug-info will be downloaded automatically.

Checking ports...
Port check successful!

Please press enter to start tracelogging...

Power supply already active!
Turning power supply off...
Turning power supply on...

Tracelogging active...

Turning ignition: ON
>> ignition on ()
Please perform test on unit. Press "Ctrl-C" after test is finished.
Unit powerusage is at 2.76 Ampere █
```

Feature summary

- ▶ Low power consumption
 - ▶ ~ 30 kWh / year
- ▶ Distributed system
 - ▶ No single point of failure
- ▶ Allows permanent logging
 - ▶ E.g. during updates, non-testing activities
- ▶ Link to SVN
 - ▶ Get SW update from SVN and install update
 - ▶ Do test (semi-manually)
 - ▶ Put test results and traces to SVN

Outlook

- ▶ Additional capabilities
 - ▶ CAN/LIN/UART
 - ▶ Simulate key panel / touch pad inputs
 - ▶ speed signals
 - ▶ Image recognition
 - ▶ LVDS screen grabber
 - ▶ internal screenshots
 - ▶ Audio I/O
- ▶ New applications
 - ▶ automated updates (e.g. new map data)
 - ▶ software development
 - ▶ main unit configuration utilities
